

Digital Design & Computer Architecture

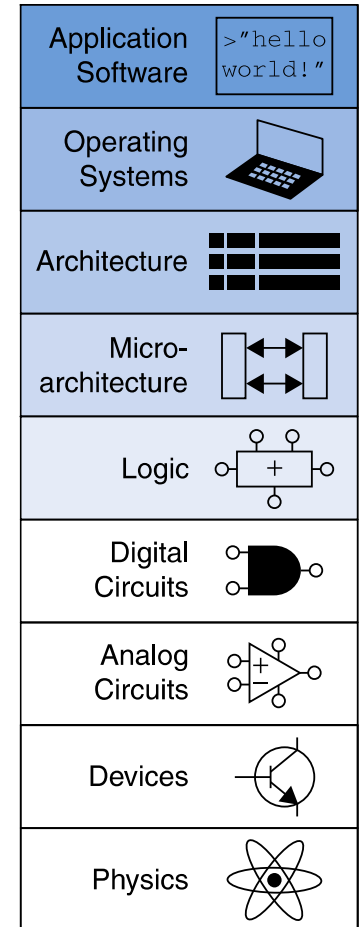

Sarah Harris & David Harris

with Joshua Brake

Chapter 9: Embedded Systems

Chapter 9 :: Topics

- Microcontrollers
- RISC-V Microcontrollers
- Memory-Mapped I/O
- General-Purpose I/O
- Device Drivers
- Delays & Timers
- Example: Morse Code
- Interfacing
- Serial Peripheral Interface
- Example: SPI Accelerometer

Microcontrollers

- **Microprocessors** are **computers on a chip**
- **Microcontrollers** are microprocessors with **flexible input/output (I/O) peripherals**
- **Peripheral examples:**
 - General-purpose I/O (GPIO): turn pins ON and OFF
 - Serial ports
 - Timers
 - Analog/Digital and Digital/Analog Converters (ADC/DAC)
 - Pulse Width Modulation (PWM)
 - Universal Serial Bus
 - Ethernet

Embedded Systems

- Microcontrollers are commonly used in embedded systems
- An embedded system is a system whose user may be unaware there is a computer inside
- **Examples:**
 - Microwave oven
 - Clock/radio
 - Electronic fuel injection
 - Annoying toys with batteries for toddlers
 - Implantable glucose monitor

Microcontroller Economics

- In 2019, about **26 billion microcontrollers sold**
 - Average price: **60 cents**
 - About **70 microcontrollers in an average new car**
- **Biggest markets:**
 - Automotive (~70 microcontrollers in an average new car)
 - Consumer electronics, industrial, medical, military
- **Highly cost-sensitive market**
 - Often < \$0.40; pennies matter
 - Cheaper than using a cable or a pushrod in a system
 - A microcontroller integrated on a larger chip can have a manufacturing cost of < \$0.001
- **Memory tends to dominate the cost**
 - Select one with no more memory than necessary
- **Classified as 8, 16, 32-bit based on internal bus**
 - 1970s vintage 8-bit processors can still be adequate
 - 16-bit have greatest revenue in 2019
 - 32-bit processors are faster and more flexible but use more code memory

Microprocessor Architectures

- The architecture is the native machine language a microprocessor understands.
- **Commercial Examples:**
 - RISC-V
 - ARM
 - PIC
 - 8051

Chapter 9: Embedded Systems

RISC-V

Microcontrollers

RISC-V Microcontrollers

- RISC-V is an **open-standard** architecture
 - Developed at Berkeley starting in 2010
 - No licensing fees
 - Increasingly popular, especially for system-on-chip
- **SiFive Freedom E310-G002**
 - Second generation RISC-V microcontroller (2019)
 - Found on several low-cost boards

SiFive Freedom E310 Microprocessor

- E31 microprocessor with **5-stage pipeline**
 - Similar to the one we will discuss in class
 - RV32IMAC architecture
 - Baseline **32-bit RISC-V** Integer instructions
 - Plus **M**ultiply/Divide, **A**tomic Memory, **C**ompressed operations
 - 2.73 Coremark/MHz
- **Electrical Specs**
 - Up to 320 MHz
 - Built in antiquated 180 nm process
 - 1.8V core and 3.3V I/O

FE310 Memory & I/O

- **Onboard Memory**

- 16 KB Data SRAM
- 16 KB Instruction Cache
- 8 KB Mask ROM & 8 KB OTP (one-time-programmable) Program Boot Memory
- Most instructions located on external Flash

- **I/O Peripherals**

- 19 GPIO Pins
- Serial Ports: SPI x2, I2C, UART x2
- PWM x3
- Timer
- JTAG Debugger Interface

FE310 Pinout

- **48-pin QFN** (quad flat pack, no leads)
 - Hard to hand solder
- **Pins:**
 - 12 power (GND pad on back)
 - 19 GPIO
 - 4 JTAG programming
 - 6 QSPI Flash code link
 - 2 clock crystals
 - 6 control

Comparison of FE310 Boards

- **Boards are functionally similar**
 - Can operate off USB connection
 - Power, programming, debugging
 - External power connector
 - All I/Os tapped out to pins
 - Software compatible
- This course uses **RED-V Thing Plus** for labs
 - Lowest cost
 - Breadboard-compatible

FE310 Datasheets

- **FE310-G002 Datasheet**
 - Pinout
 - Electrical specifications
 - Information for board designer
- **FE310-G002 Manual**
 - Microprocessor core
 - Memory map
 - Peripherals
 - Information for firmware engineer / programmer

Chapter 9: Embedded Systems

Memory-Mapped I/O

Memory-Mapped I/O

- Control peripherals by **reading or writing memory locations** called *registers*
 - Not really the same as a bank of flip-flops
- Just like accessing any other variable, but these registers cause **physical things** to happen.
- Portion of the address space is **reserved for I/O** registers rather than program or data.
- In C, use **pointers** to specify addresses to read or write.

Example: FE310 Memory Map

- **Boot ROM:**
 - 0x00010000-1FFFFF
- **Code Flash:**
 - 0x20000000-3FFFFFFF
- **Data SRAM:**
 - 0x80000000-80003FFF
- **Peripherals:**
 - 0x02000000-0x1FFFFFFF

Base	Top	Attr.	Description	Notes

Memory Mapped I/O in C

```
#include <stdint.h>

// Pointers to memory-mapped I/O registers
volatile uint32_t *GPIO_INPUT_VAL = (uint32_t*)0x10012000;
volatile uint32_t *GPIO_OUTPUT_VAL = (uint32_t*)0x1001200C;

// read all the GPIO inputs
uint32_t allInputs = *GPIO_INPUT_VAL;

// read GPIO bit 19
int gpio19 = (*GPIO_INPUT_VAL >> 19) & 0b1;

// Wait for bit 19 to be 0
while ((*GPIO_INPUT_VAL >> 19) & 0b1);

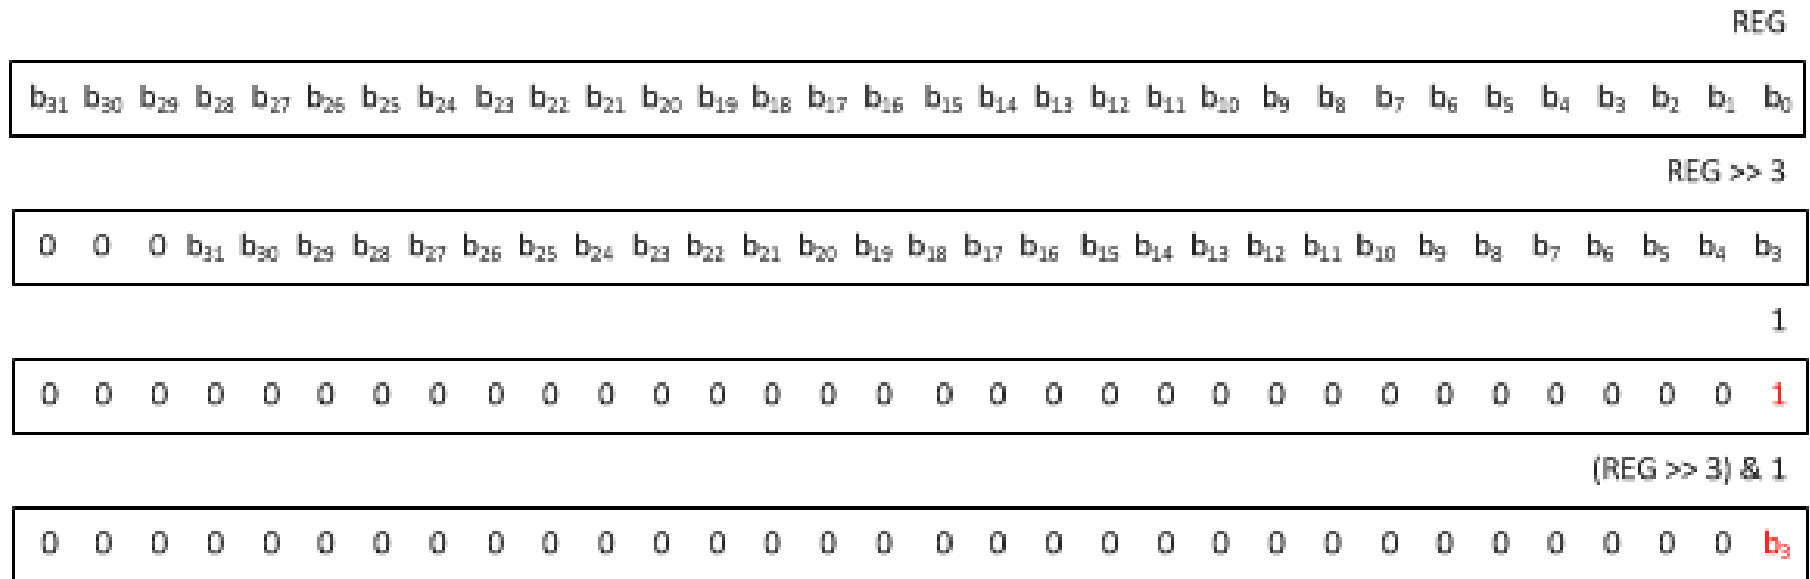

// Wait for bit 19 to be 1
while (!((*GPIO_INPUT_VAL >> 19) & 0b1));

// Write 1 to GPIO bit 5
*GPIO_OUTPUT_VAL |= (1<<5);

// Write 0 to GPIO bit 5
*GPIO_OUTPUT_VAL &= ~(1<<5);
```

C Idioms: Read value of bit

```
int bit = (*REG >> 3) & 1; // get value of bit 3
```

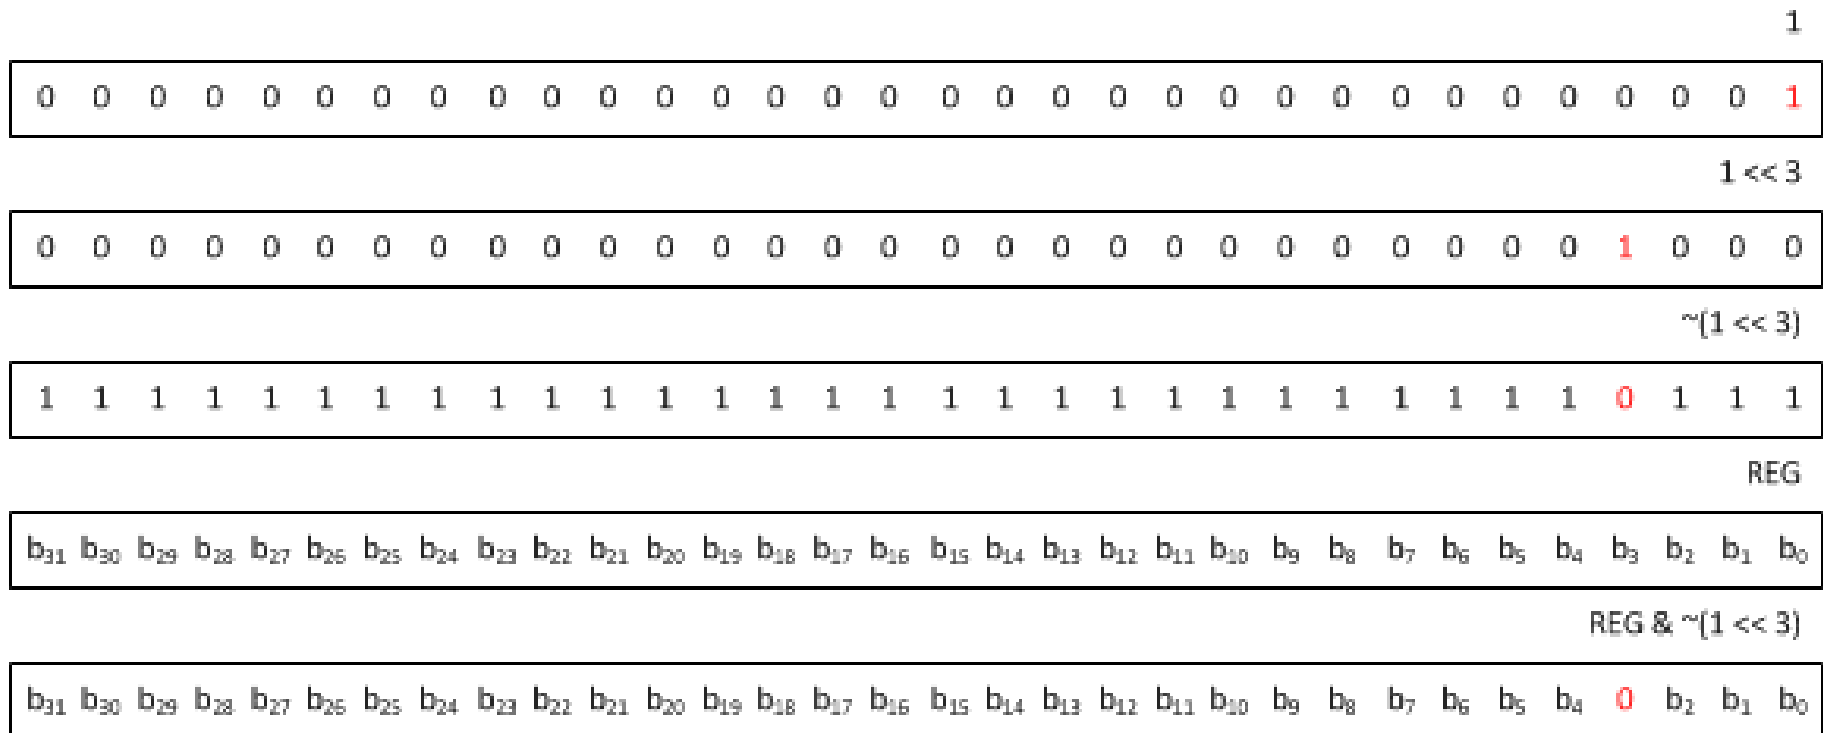

C Idioms: Write Bit to 1

```
*REG |= (1 << 3);           // turn on bit 3
```

C Idioms: Write Bit to 0

```
*REG &= ~(1 << 3);    // turn off bit 3
```

Chapter 9: Embedded Systems

General Purpose I/O (GPIO)

General-Purpose I/O (GPIO)

- GPIOs can be written (driven to 0 or 1) or read.
- **Examples:** LEDs, switches, connections to other digital logic
- **In general:**
 - Look up how many pins your microcontroller has, how they are named.
 - Each pin needs to be configured as an input, output, or special function.
 - Then read or write the pin.

FE310 GPIOs

- **19 GPIOs connected to external pins**
 - Not enough pins for all 32 GPIOs
- **Some GPIOs have multiple functions**
- **Blue LED on RED-V board**
 - Connected to GPIO5

FE310 GPIO Registers

From FE310 Manual

- Base Address
 - 0x10012000
- 32 bits/reg
 - For 32 GPIOs
- * means enable resets to 0
- Turn on enable to use GPIO

Offset	Name	Description
0x00	input_val	Pin value
0x04	input_en	Pin input enable*
0x08	output_en	Pin output enable*
0x0C	output_val	Output value
0x10	pue	Internal pull-up enable*
0x14	ds	Pin drive strength
0x18	rise_ie	Rise interrupt enable
0x1C	rise_ip	Rise interrupt pending
0x20	fall_ie	Fall interrupt enable
0x24	fall_ip	Fall interrupt pending
0x28	high_ie	High interrupt enable
0x2C	high_ip	High interrupt pending
0x30	low_ie	Low interrupt enable
0x34	low_ip	Low interrupt pending
0x40	out_xor	Output XOR (invert)

0x38	iof_en	Enable I/O function
0x3C	iof_sel	Select I/O function

FE310 GPIO With Enables

```
#include <stdint.h>
volatile uint32_t *GPIO_INPUT_VAL = (uint32_t*)0x10012000;
volatile uint32_t *GPIO_INPUT_EN = (uint32_t*)0x10012004;
volatile uint32_t *GPIO_OUTPUT_EN = (uint32_t*)0x10012008;
volatile uint32_t *GPIO_OUTPUT_VAL = (uint32_t*)0x1001200C;

// Enable input 19 and output 5
*GPIO_INPUT_EN |= (1 << 19);
*GPIO_OUTPUT_EN |= (1 << 5);

// read GPIO bit 19
int gpio19 = (*GPIO_INPUT_VAL >> 19) & 0b1;

// Wait for bit 19 to be 1
while (!((*GPIO_INPUT_VAL >> 19) & 0b1));

// Write 1 to GPIO bit 5
*GPIO_OUTPUT_VAL |= (1<<5);

// Write 0 to GPIO bit 5
*GPIO_OUTPUT_VAL &= ~(1<<5);
```

RED-V RedBoard Pin Names

- RED-V RedBoard has Arduino-style pin names
 - Translate these to **GPIO numbers**

Red-V Pin Name	GPIO Number
D0	16
D1	17
D2	18
D3	19
D4	20
D5	21
D6	22
D7	23
D8	0
D9	1
D10	2
D11	3
D12	4
D13	5
D15	9
D16	10
D17	11
D18	12
D19	13

Example: Switches & LEDs

- Read a switch and drive an LED
 - (Could have done this with a wire!)

```
#include <stdint.h>
void main(void) {
    volatile uint32_t *GPIO_INPUT_VAL = (uint32_t*)0x10012000;
    volatile uint32_t *GPIO_INPUT_EN = (uint32_t*)0x10012004;
    volatile uint32_t *GPIO_OUTPUT_EN = (uint32_t*)0x10012008;
    volatile uint32_t *GPIO_OUTPUT_VAL = (uint32_t*)0x1001200C;
    int val;

    *GPIO_INPUT_EN |= (1 << 19); // Set pin 19 to input
    *GPIO_OUTPUT_EN |= (1 << 5); // set pin 5 to output
    while (1) {
        val = (*GPIO_INPUT_VAL >> 19) & 1; // Read value on pin 19
        if (val) *GPIO_OUTPUT_VAL |= (1 << 5); // Turn ON pin 5
        else *GPIO_OUTPUT_VAL &= ~(1 << 5); // Turn OFF pin 5
    }
}
```

Other I/O Functions

- Most GPIO pins also have **other special functions**
 - Serial Ports: SPI, I2C, UART
 - Pulse Width Modulation
- Activate with GPIO registers
 - iof_en enables special function
 - iof_sel selects the function

GPIO Number	IOF0	IOF1
0		PWM0_PWM0
1		PWM0_PWM1
2	SPI1_CS0	PWM0_PWM2
3	SPI1_DQ0	PWM0_PWM3
4	SPI1_DQ1	
5	SPI1_SCK	
6	SPI1_DQ2	
7	SPI1_DQ3	
8	SPI1_CS1	
9	SPI1_CS2	
10	SPI1_CS3	PWM2_PWM0
11		PWM2_PWM1
12	I2C0_SDA	PWM2_PWM2
13	I2C0_SCL	PWM2_PWM3
14		
15		
16	UART0_RX	
17	UART0_TX	
18	UART1_TX	
19		PWM1_PWM1
20		PWM1_PWM0
21		PWM1_PWM2
22		PWM1_PWM3
23	UART1_RX	
24		
25		
26	SPI2_CS0	
27	SPI2_DQ0	
28	SPI2_DQ1	
29	SPI2_SCK	
30	SPI2_DQ2	
31	SPI2_DQ3	

From FE310 Manual

Chapter 9: Embedded Systems

EasyREDVIO

Device Driver

Library

Device Drivers

- Controlling memory mapped I/O with pointers is **error-prone**
 - Hard to see the big picture
 - Easy to mistype address of GPIO
 - Pointer programming can confuse beginners
- Write **device driver** functions to hide the details
- We will develop **EasyREDVIO** device driver library
 - Arduino-style interface
 - Start with GPIO

Memory-Mapped I/O with Structures

- Use **structures** to define memory-mapped I/O
 - Less error-prone than pointers
 - Cleaner C code

EasyREDVIO Library

```
// EasyREDVIO.h
```

```
// Joshua Brake and David Harris 7 October 2020
```

```
#define INPUT 0
```

```
#define OUTPUT 1
```

```
// Declare a GPIO structure defining the GPIO registers in the order they appear in memory mapped I/O
```

```
typedef struct
```

```
{
```

```
    volatile uint32_t input_val;    // (GPIO offset 0x00) Pin value
```

```
    volatile uint32_t input_en;    // (GPIO offset 0x04) Pin input enable*
```

```
    volatile uint32_t output_en;    // (GPIO offset 0x08) Pin output enable*
```

```
    volatile uint32_t output_val;    // (GPIO offset 0x0C) Output value
```

```
    volatile uint32_t pue;          // (GPIO offset 0x10) Internal pull-up enable*
```

```
    volatile uint32_t ds;           // (GPIO offset 0x14) Pin drive strength
```

```
    volatile uint32_t rise_ie;      // (GPIO offset 0x18) Rise interrupt enable
```

```
    volatile uint32_t rise_ip;      // (GPIO offset 0x1C) Rise interrupt pending
```

```
    volatile uint32_t fall_ie;      // (GPIO offset 0x20) Fall interrupt enable
```

```
    volatile uint32_t fall_ip;      // (GPIO offset 0x24) Fall interrupt pending
```

```
    volatile uint32_t high_ie;      // (GPIO offset 0x28) High interrupt enable
```

```
    volatile uint32_t high_ip;      // (GPIO offset 0x2C) High interrupt pending
```

```
    volatile uint32_t low_ie;       // (GPIO offset 0x30) Low interrupt enable
```

```
    volatile uint32_t low_ip;       // (GPIO offset 0x34) Low interrupt pending
```

```
    volatile uint32_t iof_en;       // (GPIO offset 0x38) HW-Driven functions enable
```

```
    volatile uint32_t iof_sel;      // (GPIO offset 0x3C) HW-Driven functions selection
```

```
    volatile uint32_t out_xor;      // (GPIO offset 0x40) Output XOR (invert)
```

```
} GPIO;
```

```
// Define the base address of the GPIO registers and a pointer to this structure
```

```
// The 0x...U notation in 0x10012000U indicates an unsigned hexadecimal number
```

```
#define GPIO0_BASE (0x10012000U)
```

```
#define GPIO0 ((GPIO*) GPIO0_BASE)
```

EasyREDVIO Library

```
void pinMode(int gpio_pin, int function) {
    switch(function) {
        case INPUT:
            GPIO0->input_en  |= (1 << gpio_pin); // Sets a pin as an input
            GPIO0->output_en  &= ~(1 << gpio_pin); // Disable output
            GPIO0->iof_en     &= ~(1 << gpio_pin); // Disable IOF
            break;
        case OUTPUT:
            GPIO0->output_en  |= (1 << gpio_pin); // Set pin as an output
            GPIO0->input_en   &= ~(1 << gpio_pin); // Disable input
            GPIO0->iof_en     &= ~(1 << gpio_pin); // Disable IOF
            break;
    }
}

void digitalWrite(int gpio_pin, int val) {
    if (val) GPIO0->output_val |= (1 << gpio_pin);
    else     GPIO0->output_val &= ~(1 << gpio_pin);
}

int digitalRead(int gpio_pin) {
    return (GPIO0->input_val >> gpio_pin) & 0x1;
}
```

Example: Switches & LEDs

- Reprised with EasyREDVIO
 - Control all three LEDs

```
#include "EasyREDVIO.h"
int main(void) {
    // Set GPIO 4:2 as inputs
    pinMode(2, INPUT);
    pinMode(3, INPUT);
    pinMode(4, INPUT);
    // Set GPIO 10:8 as outputs
    pinMode(8, OUTPUT);
    pinMode(9, OUTPUT);
    pinMode(10, OUTPUT);
    while (1) { // Read each switch and write corresponding LED
        digitalWrite(8, digitalRead(2));
        digitalWrite(9, digitalRead(3));
        digitalWrite(10, digitalRead(4));
    }
}
```

Chapter 9: Embedded Systems

Delays & Timers

Generating Delays

```
#define COUNTS_PER_MS 1600
```

```
void delayLoop(int ms) {  
    // declare loop counter volatile so it isn't optimized away  
    // COUNTS_PER_MS empirically determined such that  
    // delayLoop(1000) waits 1 sec  
    volatile int i = COUNTS_PER_MS * ms;  
    while (i--); // count down time  
}
```

Blink Light

```
void flash(void) {  
    pinMode(5, OUTPUT);  
  
    while (1) {  
        digitalWrite(5, 1);  
        delayLoop(500);  
        digitalWrite(5, 0);  
        delayLoop(500);  
    }  
}
```

Timers

- **delayLoop** requires calibrating **COUNTS_PER_MS**
 - Tedious to calibrate by hand
 - Inexact
 - Could break if compiler optimizes better
- **Timers** are peripherals for time measurement
- FE310 has one **64-bit timer**
 - Counts ticks of an external 32.768 KHz oscillator

Timer Register

- Timers accessed through memory-mapped I/O
- FE310 timer in Core-Local Interruptor (CLINT)
 - 64-bit **mtime** register at **0x0200BFF8**

Address	Width	Attr.	Description	Notes
0x2000000	4B	RW	msip for hart 0	MSIP Registers (1 bit wide)
0x2004008			Reserved	
...				
0x200bff7				
0x2004000	8B	RW	mtimecmp for hart 0	MTIMECMP Registers
0x2004008			Reserved	
...				
0x200bff7				
0x200bff8	8B	RW	mtime	Timer Register
0x200c000			Reserved	

Table 24: CLINT Register Map

From FE310 Manual

Delay with Timer

```
void delay(int ms) {  
    volatile uint64_t *mtime = (uint64_t*)0x0200bff8;  
    uint64_t doneTime = *mtime + (ms*32768)/1000;  
  
    while (*mtime < doneTime); // wait until time is reached  
}
```

Chapter 9: Embedded Systems

Example: Morse Code

Morse Code Example

- Play a message in Morse code by blinking LEDs.
- Demonstrate EasyREDVIO
- Similarities to Lab 7

Morse Code Example

```
// morse.c
```

```
// David_Harris@hmc.edu
```

```
// Arduino-like library for IO functions
```

```
#include "EasyREDVIO.h"
```

```
#define DUR 100
```

Morse Code Example

```
// Define Morse code for letters
```

```
char codes[26][5] = {
```

```
    "-.", // A
```

```
    "-...", // B
```

```
    "-.-.", // C
```

```
    "-..", // D
```

```
    ".-", // E
```

```
    "..-.", // F
```

```
    "--.", // G
```

```
    "....", // H
```

```
    "...", // I
```

```
    ".---", // J
```

```
    "-.-", // K
```

```
    "-.-.", // L
```

```
    "--", // M
```

```
    "-.", // N
```

```
    "---", // O
```

```
    ".-.-", // P
```

```
    "--.-", // Q
```

```
    "-.-.", // R
```

```
    "...", // S
```

```
    "-.", // T
```

```
    "-..", // U
```

```
    "....", // V
```

```
    ".-.-", // W
```

```
    "-.-.-", // X
```

```
    "-.-.-", // Y
```

```
    "--.." // Z
```

```
};
```

Morse Code Example

```
void playChar(char c) {  
    int i=0;  
  
    while (codes[c-'A'][i]) {  
        digitalWrite(5, 1); // turn on LED  
        if (codes[c-'A'][i] == '.') delay(DUR); // dot  
        else          delay(3*DUR); // dash  
        digitalWrite(5, 0); // turn off LED  
        delay(DUR); // pause between elements  
        i++;  
    }  
    delay(DUR*2); // extra pause between characters  
}
```

Morse Code Example

```
void playStr(char msg[]) {  
    int i=0;  
  
    while(msg[i]) playChar(msg[i++]);  
}
```

Morse Code Example

```
int main(void) {  
    pinMode(5, OUTPUT); // Blue LED  
    while (1) {  
        playStr("SOS");  
        // pause between words  
        delay(DUR*4);  
    }  
}
```

Chapter 9: Embedded Systems

Interfacing

Interfacing

- **Interfacing:** connecting external devices to a microcontroller
 - Sensors
 - Actuators
 - Other Processors
- **Interfacing Methods**
 - **Parallel**
 - **Serial**
 - **SPI:** Serial Peripheral Interface
 - 1 clock, 1 data out, 1 data in pin
 - **UART:** Universal Asynchronous Receiver/Transmitter
 - no clock, 1 data out, 1 data in pin, agree in software about intended data rate
 - **I2C:** Inter-Integrated Circuit
 - 1 clock, 1 bidirectional data pin
 - **Analog**
 - **ADC:** Analog/Digital Converter
 - **DAC:** Digital/Analog Converter
 - **PWM:** Pulse Width Modulation

Parallel Interfacing

- Connect **1 wire / bit** of information
 - **Example:** 8-bit parallel interface to send a byte at a time
- Also send **clock** or **REQ/ACK** (request/acknowledge) to indicate when data is ready
- Parallel busses are **expensive** and **cumbersome** because of the large number of wires
- Mostly used for **high-performance applications** such as DRAM interfaces

Serial Interfacing

- Serial interface sends **one bit at a time**
 - Use many clock cycles to send a large block of information
 - Also send timing information about when the bits are valid
- **Common Serial Interfaces:**
 - Serial Peripheral Interface (**SPI**)
 - Serial clock, 2 unidirectional data wires (MOSI, MISO)
 - Very common, easy to use
 - Inter-Integrated Circuit (**I2C**) “I squared C”
 - 1 clock, 1 bidirectional data wire
 - Fewer wires, more complex internal hardware
 - Universal Asynchronous Receiver/Transmitter (**UART**) “you-art”
 - 2 unidirectional data wires (Tx, Rx)
 - Asynchronous (no clock); configure (agreed upon) speed at each end

Chapter 9: Embedded Systems

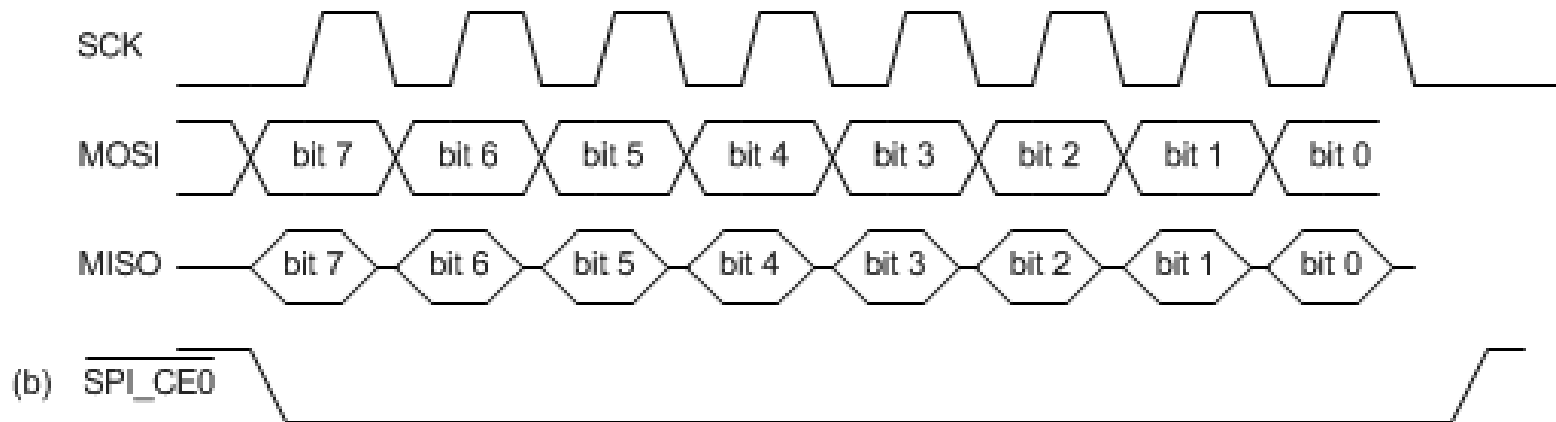

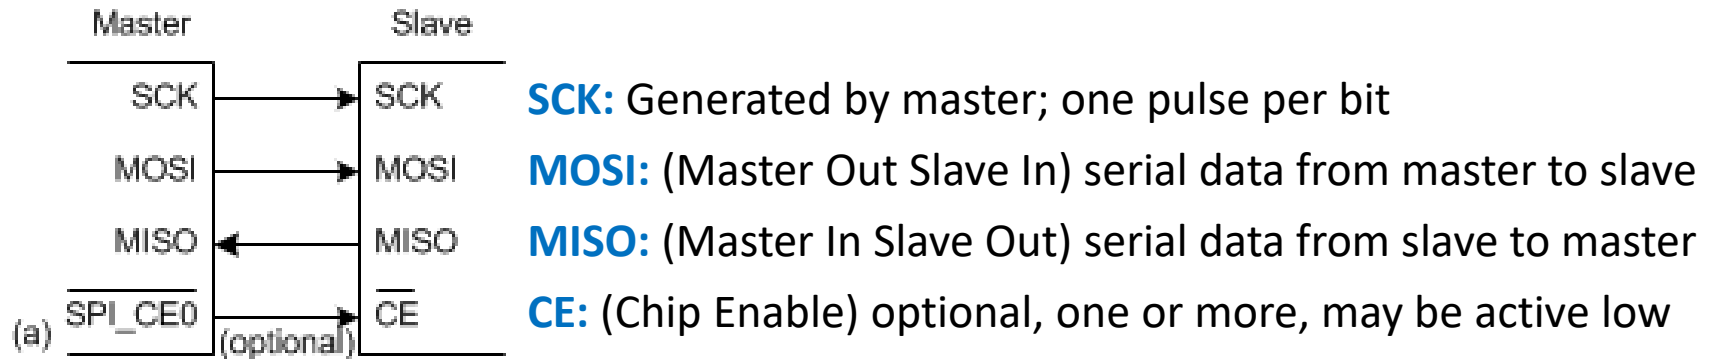

SPI

Serial Peripheral Interface (SPI)

- SPI is an easy way to connect devices
- **Master device** communicates with one or more **slave devices**
 - **Slave select signals** indicate which slave is chosen
 - **Master sends clock and data out. Slave sends back data in.**
- **Signals:**
 - **SCK/SCLK:** (Serial Clock) Generated by master; one pulse per bit
 - **MOSI:** (Master Out Slave In) serial data from master to slave
 - **MISO:** (Master In Slave Out) serial data from slave to master
 - **SS/CE/CS:** (Slave select/Chip Enable/Chip Select) optional, one or more, may be active low

SPI Waveforms

- SPI Slave hardware can be just a **shift register**

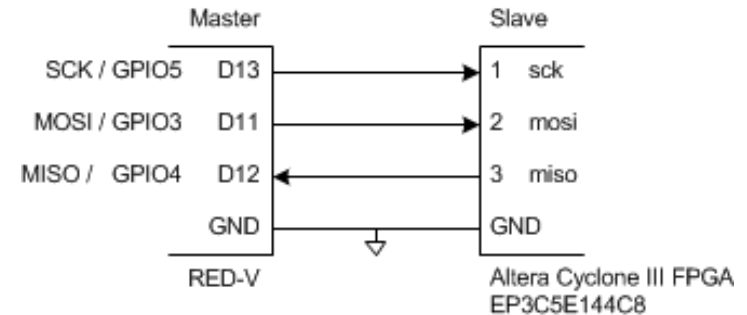

SPI Connection

Generic Master to Several Slaves

RED-V Master to One Slave

en.wikipedia.org/wiki/Serial_Peripheral_Interface_Bus#/media/File:SPI_three_slaves.svg

Slave Select

- Slave Select is **active low**
 - Various named NSS or \overline{SS} or \overline{CE} or \overline{CS}
 - Turns ON device when 0, OFF when 1
- Turning **OFF** the slave device may **save power**
- **Options:**
 - **1 slave device:** tie slave select active
 - **1 or more slave devices:** use GPIO pins to turn desired device ON before SPI transaction, turn device back OFF afterward
 - **1 or more slave devices:** use SPI controller to automatically pulse the desired SS pin during a transaction

SPI Communication

- **Configure**
 - **Choose port**
 - FE310 has SPI1 and SPI2. Let's use SPI1.
 - **Set SPI SCK, MISO, MOSI, CS0 pins to IOF0 mode**
 - **Set Baud Rate** (1 MHz or less prudent on a breadboard)
 - **Clock Polarity**
 - CPOL = 0 (default): clock idles at 0
 - CPOL = 1: clock idles at 1
 - **Clock Phase**
 - CPHA = 0: sample MOSI on the first clock transition
 - CPHA = 1: sample MOSI on the second clock transition
 - **Set other control registers as needed**
 - See EasyREDVIO code

SPI Communication Continued

- **Transmit data**

- **Wait** for the **txdata full flag** to be 0 indicating SPI is ready for new data.
- **Write byte** to **txdata** data field.
- **SPI** will generate 8 clocks and send the 8 bits of data, while receiving 8 bits back.

- **Receive data**

- **Read rxdata register.**
- If **rxdata empty** flag is 1, there is no data yet. Repeat read.
- When empty flag is 0, there is valid data in the **rxdata** field.

SPI Registers

- **Base Address**
 - SPI1 0x10024000
 - SPI2 0x10034000
- **Baud Rate**
 - sckdiv bits 11:0 indicate div
 - $F_{sck} = F_{in} / 2(div+1)$
 - F_{in} is 16 MHz coreclk
- **Clock Mode**
 - sckmode bit 0: pha (Clock Phase)
 - sckmode bit 1: pol (Clock Polarity)
- **Transmit Data Register**
 - txdata bits 7:0: data (write to transmit)
 - txdata bit 31: full (1 indicates FIFO can accept data)
- **Receive Data Register**
 - rxdata bits 7:0: data (read received data)
 - rxdata bit 31: empty (1 indicates no data ready)

    while(1) {
        spiSendReceive('0x60');
        sample = spiSendReceive('0x00');
        printf("Read %d\n", sample);
        delay(200);
    }
}
```

Chapter 9: Embedded Systems

Example: **SPI Accelerometer**

Example: SPI Interface to Accelerometer

- **LIS3DH 3-axis accelerometer**
 - Measures X, Y, Z acceleration
 - 2-8 G Full scale (configurable)
 - SPI interface with 16-bit transfers
 - ~1 mg sensitivity
 - 3x3 mm land grid array package
 - Hard to assemble without tooling
 - Available on a breakout board
 - \$4.95 from Adafruit

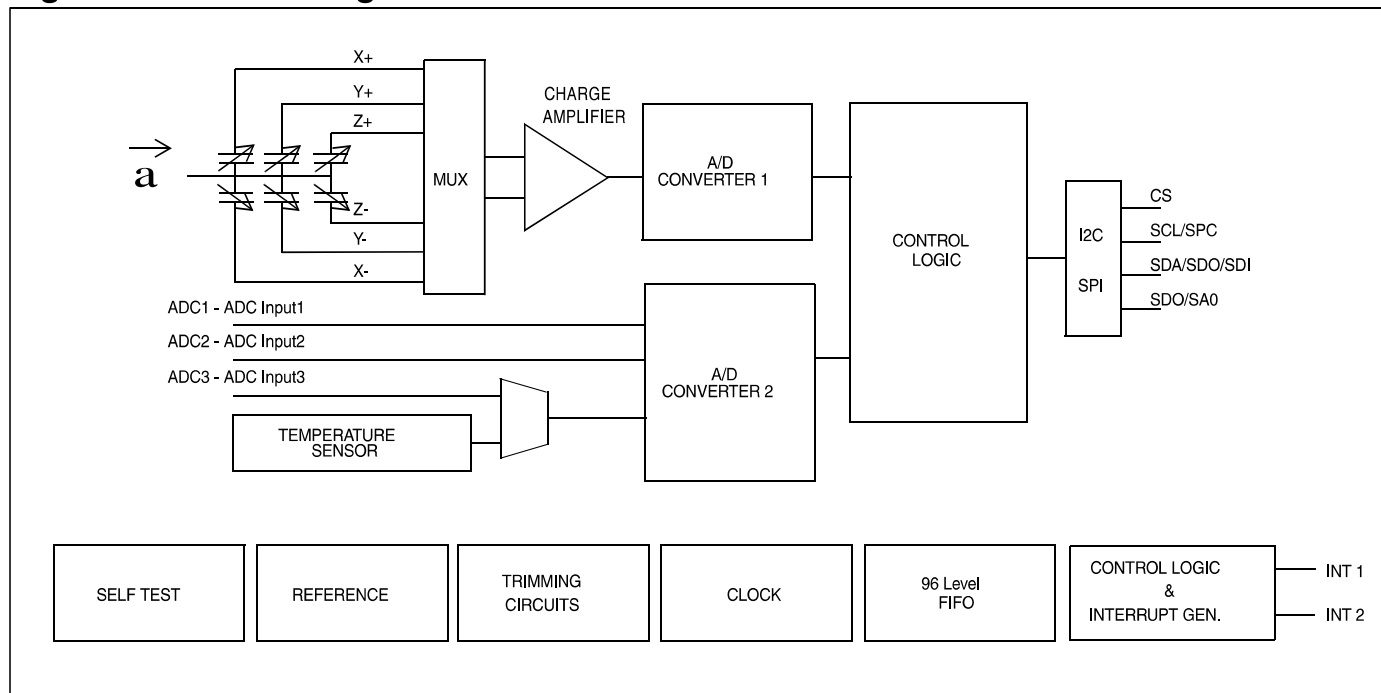

LGA-16 (3x3x1 mm)

LIS3DH Internal Operation

- MEMS cantilevers move based on acceleration
- Changes capacitance, sensed by ADC
- Temperature compensation for good accuracy

Figure 1. Block diagram

st.com LIS3DH Data Sheet

Microcontroller → Accel Interface

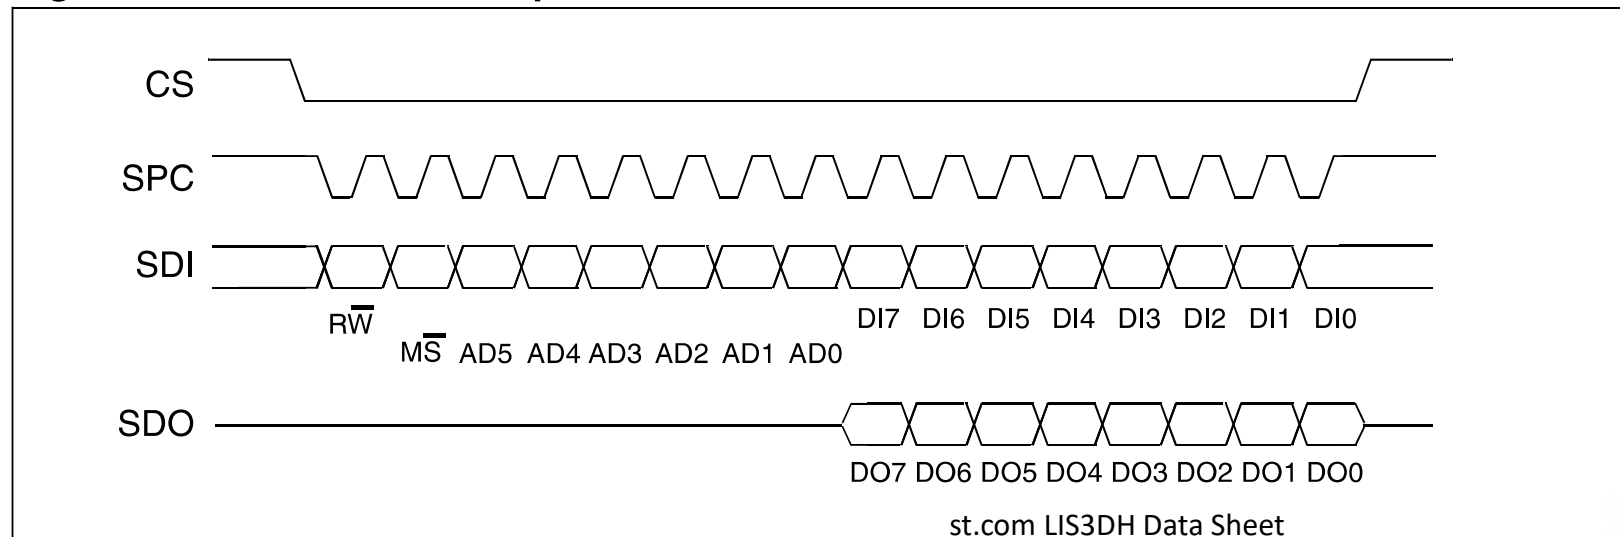

- 3.3V, GND
 - Connecting 5V may cook LIS3DH
- SPI interface
- LIS3DH also has I2C interface
 - Don't connect these pins

SPI Data Packets

- Communicate with SPI through internal registers
- Each register has 6-bit address, 8 bits of data
- Use a 16-bit SPI transaction
 - $RW_{bar} = 1$ to read, 0 to write. $MS_{bar} = 0$ for single register accesses
 - Keep CS low for entire 16 cycles

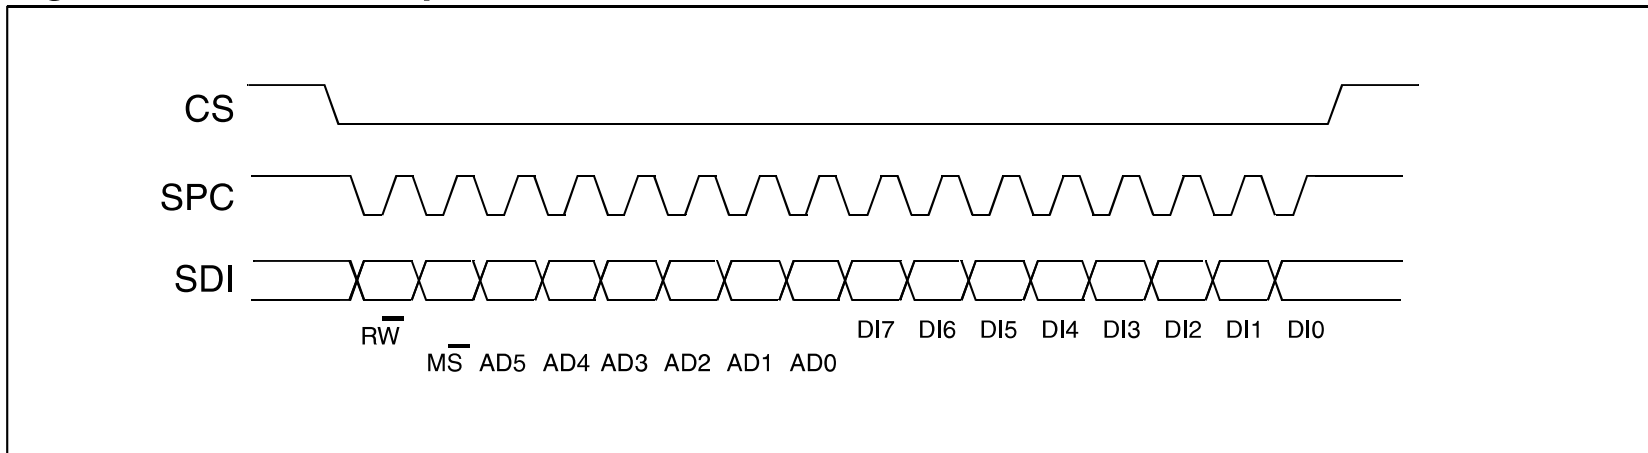

Figure 6. Read and write protocol

SPI Write

- $\overline{RW} = 0$. $\overline{MS} = 0$
- Send 6-bit address of register to write
- Send 8 bit data value to write to register
- Receive 8 bits of dummy data back (discard)

Figure 9. SPI write protocol

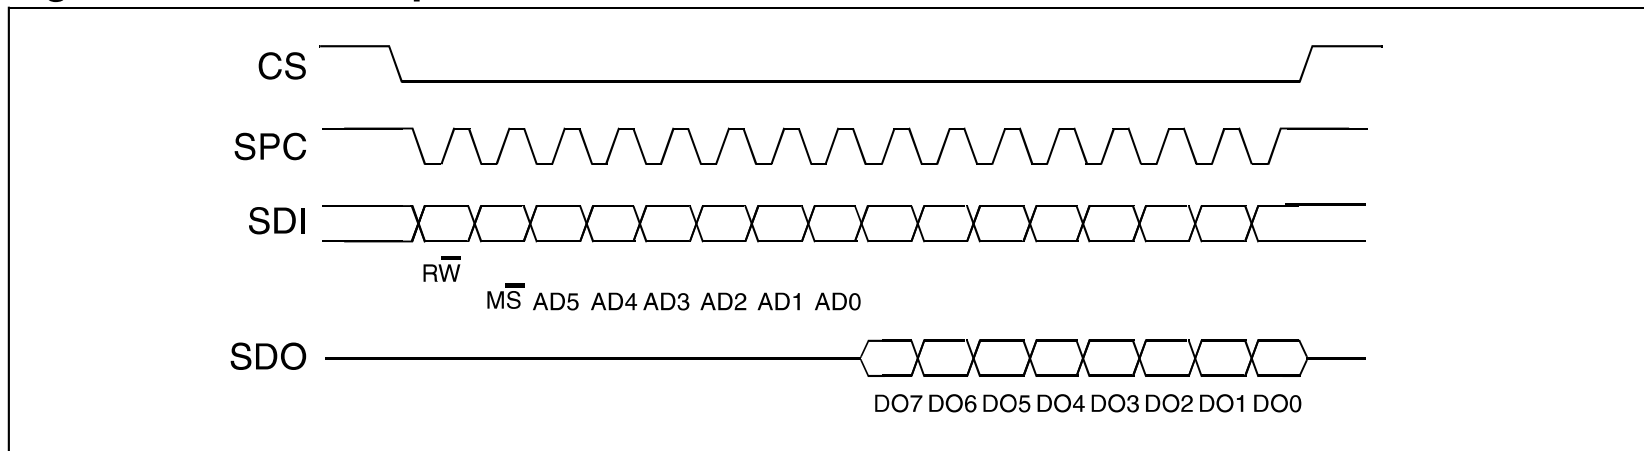

st.com LIS3DH Data Sheet

SPI Read

- $\overline{RW} = 1$. $\overline{MS} = 0$
- Send 6-bit address of register to read
- Send 8 bit dummy data
- Receive 8 bits of read data

Figure 7. SPI read protocol

st.com LIS3DH Data Sheet

LISD3H Registers

- Read WHO_AM_I to check SPI interface working
- Write CTRL_REG to configure accel
- Read OUT_X/Y/Z registers to measure acceleration
 - 16-bit 2's complement values
 - Stored in 8-bit high and low regs

Table 17. Register address map

LISD3H WHO_AM_I

- WHO_AM_I register (0x0F) always reads 0x33 = 51
 - Easy way to check your SPI wiring is correct

WHO_AM_I (0Fh)

Table 21. WHO_AM_I register

0	0	1	1	0	0	1	1
---	---	---	---	---	---	---	---

Device identification register.

st.com LIS3DH Data Sheet

LISD3H Control Registers

- CTRL_REG1 (0x20)
 - Write 0x77
 - Enable X, Y, Z axis measurements
 - Normal mode 400 Hz sampling

CTRL_REG1 (20h)

Table 24. CTRL_REG1 register

ODR3	ODR2	ODR1	ODR0	LPen	Zen	Yen	Xen
------	------	------	------	------	-----	-----	-----

Table 25. CTRL_REG1 description

ODR3-0	Data rate selection. Default value: 00 (0000:50 Hz; Others: Refer to Table 25 , "Data rate configuration")
LPen	Low power mode enable. Default value: 0 (0: normal mode, 1: low power mode)
Zen	Z axis enable. Default value: 1 (0: Z axis disabled; 1: Z axis enabled)
Yen	Y axis enable. Default value: 1 (0: Y axis disabled; 1: Y axis enabled)
Xen	X axis enable. Default value: 1 (0: X axis disabled; 1: X axis enabled)

ODR<3:0> is used to set power mode and ODR selection. In the following table are reported all frequency resulting in combination of ODR<3:0>

Table 26. Data rate configuration

ODR3	ODR2	ODR1	ODR0	Power mode selection
0	0	0	0	Power down mode
0	0	0	1	Normal / low power mode (1 Hz)
0	0	1	0	Normal / low power mode (10 Hz)
0	0	1	1	Normal / low power mode (25 Hz)
0	1	0	0	Normal / low power mode (50 Hz)
0	1	0	1	Normal / low power mode (100 Hz)
0	1	1	0	Normal / low power mode (200 Hz)
0	1	1	1	Normal / low power mode (400 Hz)
1	0	0	0	Low power mode (1.6 KHz)
1	0	0	1	Normal (1.25 kHz) / low power mode (5 KHz)

st.com LIS3DH Data Sheet

LISD3H Control Registers

- CTRL_REG4 (0x23)
 - Write 0x88
 - Update output after each reading
 - High resolution (16-bit) mode

CTRL_REG4 (23h)

Table 32. CTRL_REG4 register

BDU	BLE	FS1	FS0	HR	ST1	ST0	SIM
-----	-----	-----	-----	----	-----	-----	-----

Table 33. CTRL_REG4 description

BDU	Block data update. Default value: 0 (0: continuous update; 1: output registers not updated until MSB and LSB reading)
BLE	Big/little endian data selection. Default value 0. (0: Data LSB @ lower address; 1: Data MSB @ lower address)
FS1-FS0	Full scale selection. default value: 00 (00: +/- 2G; 01: +/- 4G; 10: +/- 8G; 11: +/- 16G)

Table 33. CTRL_REG4 description (continued)

HR	High resolution output mode: Default value: 0 (0: High resolution disable; 1: High resolution Enable)
ST1-ST0	Self test enable. Default value: 00 (00: Self test disabled; Other: See Table 34)
SIM	SPI serial interface mode selection. Default value: 0 (0: 4-wire interface; 1: 3-wire interface).

Table 34. Self test mode configuration

ST1	ST0	Self test mode
0	0	Normal mode
0	1	Self test 0
1	0	Self test 1
1	1	--

st.com LIS3DH Data Sheet

LISD3H Output Registers

- Read X, Y, Z acceleration as 2 bytes each
- Combine into 16-bit 2's complement numbers
- $\text{Accel} = (\text{Reading} - \text{Offset}) * \text{Scale}$
 - Must calibrate offset and scale
 - Measure reading at level, rotated +/- 90 degrees on each axis
 - Different offset and scale for each axis

Accelerometer Starter Code

```
// E85 Lab 8: Digital Level  
// David Harris & Josh Brake
```

```
#include <stdint.h>  
#include "EasyREDVIO.h"
```

Accelerometer Starter Code

```
void spiWrite(uint8_t address, uint8_t value) {  
    uint8_t hi, lo;  
    digitalWrite(2, 0);    // pulse chip select  
    hi = spiSendReceive(address);  
    lo = spiSendReceive(value);  
    digitalWrite(2, 1);    // release chip select  
    // discard returned values on a write transaction  
}
```

```
uint8_t spiRead(uint8_t address) {  
    uint8_t hi, lo;  
    digitalWrite(2, 0);    // pulse chip select  
    hi = spiSendReceive(address | 1 << 7); // set msb for reads  
    lo = spiSendReceive(0x00); // send dummy payload  
    digitalWrite(2, 1);    // release chip select  
    return lo; // return low byte from a read transaction  
}
```

Accelerometer Starter Code

```
int main(void) {
    uint8_t debug;
    int16_t x,y;

    spilnit(15, 0, 0); // Initialize SPI pins and clocks
    digitalWrite(2, 1);
    pinMode(2, OUTPUT);

    // Check WHO_AM_I register. should return 0x33 = 51
    debug = spiRead(0x0F);

    //Setup the LIS3DH for use
    spiWrite(0x20, 0x77); // highest conversion rate, all axis on
    spiWrite(0x23, 0x88); // block update, and high resolution

    while(1) {
        // Collect the X and Y values from the LIS3DH
        x = spiRead(0x28) | (spiRead(0x29) << 8);
        y = spiRead(0x2A) | (spiRead(0x2B) << 8);

        // Small delay to reduce flicker
        delay(100);
    }
}
```

Lab 8: Digital Level

- Goal of Lab 8 is to build a **digital level**
- Accelerometer code on previous pages is provided
- You move a dot around on an LED matrix to indicate tilt
- Use digitalWrite from EasyREDVIO.h

cdn-shop.adafruit.com/datasheets/454datasheet.pdf
